

13

Vegetation is open orchard bush with fine-leaved thorny trees predominating over an occasional broad-leaved variety. The terrain although very gently undulating here and there is for the most part flat and low lying (elevation 1,000 feet) with a more or less continuous short feathery grass cover. The loose, deep, easily worked sandy soil is excellent for cultivation while the lack of a thick vegetation cover makes the clearing of new farmland a relatively easy task.

241

The main cereal crop is millet and a considerable amount of guinea corn (sorghum) is grown, especially in the southern portions of the Emirate. In addition to the grain staples, beans, maize, cassava, cucumber, tomatoes, and squashes are also cultivated, while groundnuts

242

are used as the cash crop. In recent years, the agricultural department has been introducing fruit trees into the southern portions of the Emirate and scattering small orchards here and there through the northern bush with the idea of developing a local fruit industry.

[197]

The people we are concerned with refer to themselves as Kanuri and speak a language of the same name. They call their territory Bornu and sometimes refer to themselves as kan Bornube (the people of Bornu). Among Hausa speakers in Nigeria the Kanuri and their language are known as Beri-Beri, but the Kanuri rarely use this term unless they are away from Bornu.

144
[142]

Racially the Kanuri are difficult to place. Like other people at the southern rim of the Sahara they vary from negroid to caucasoid in appearance and in skin colour from coppery brown to very dark. Studies by Chalmers on blood group characteristics have shown that when lumped with other northern Muslim peoples the Kanuri indicate considerable similarity in ABO, MNS, and Rhesus blood groups, to

143

144

southern Nigerians. The comparatively high frequency of Rho (cDe) chromosome, characteristic of other African populations south of the Sahara, (1) is also present among the Kamuri.

162

The Kamuri are sedentary agriculturalists and live in various sized settlements scattered homogeneously throughout the Emirate. In their language they distinguish three kinds of settlements primarily on the basis of size. The largest category, birni (city) refers to centers of population containing 12,000 to 15,000 and over. Besides Maiguguri, the capital, there are only two or three other centers of such large proportion. Villages (hala) form the most numerous category and vary in population from a few hundred to about ten thousand. The last category, hamlets (balades), contain from fifteen to twenty up to several hundred. For political purposes and the gathering of national census data hamlets are lumped in with villages and called village areas. This makes it difficult to tell from census data what proportion of the population of these village areas live in the village itself as compared with the number living in the surrounding hamlets within the boundaries of the village area. Village area tax rolls from one district (Magumari) indicate that about one-half the population listed for any village area actually live in hamlets around the village included in its jurisdictional area.

[361]

At first sight the Bornu countryside appears to be quite thickly populated. When travelling through the bush on horseback or truck, settlements and their encircling farms follow one another after intervals of bushland with unending regularity. This first impression is misleading however for most of the area is uncultivated, unpopulated bushland and the population density is only forty to sixty per square mile. This conclusion
